

ALPHA

Titus leads the pack with the launch of the new Alpha controller!

As BACnet protocol is emerging as the leading worldwide standard for building management systems (BMS), the Titus Alpha integrates universally with all BMS manufacturers' protocols making it the universal choice.

- Alpha controller is flexible & can be used in both standalone and network applications.
- The Alpha is pre-configured at the factory, which saves time and money during installation.
- The Alpha is easier to commission through a thermostat and does not require software at the jobsite.
- The Alpha's extremely reliable one-piece design enjoys the advantage of an integrated controller, sensor, actuator, & communication. This reduces the common failures seen with typical "add-on" style designs of multiple connected components.
